Abstract

InsectVision

Computer Vision Toolbox for Insect Vision

Version 1.0.1

This version has been created as support for the article:
Gkanias E., Risse B., Mangan M., and Webb B. (2019) From skylight input to behavioural output: a computational model of the insect polarised light compass. PLOS Computational Biology.

Requirements

To be able to run all the experiments and replicate the results presented in the article, the **compmodels** package is needed. If you don't have access to this package, please contact the authors.
Clone both repositories and set the **compmodels** as a dependence to the **insectvision** package.

Observe the plots presented in the article

To see the results, it is not necessary to run the code. By simply opening the **notebooks/plos.ipynb** file, the plots should be automatically generated for you to observe them.

Replicate the results from the article

To create the plots by yourself, you need to start a **Jupyter notebook** kernel at the root of the package. Then run the **notebooks/plos.ipynb** file, which already contains all the plots and the respective code to replicate them. Some plots (especially the ones related to the global optimisation) may need a long time to run; this does not mean that they do not work.

Author

All the code has been implemented by **Evripidis Gkanias**.

Github repository

You can go the github repository by following **this** link. The release version is attached and it can also be found **here**.
